Tool Development Scale

Needs Development Ready

# N+2 GE IVP—Experiments

## Acoustic and Flow Diagnostic Tests (June—August 2011)

- Full matrix + single-flow reference nozzle
- Far-field acoustics; PIV flow diagnostics; phased array source diagnostics
- Delivered data to GE for final report.

GE Three-Stream Nozzle  
Inverted Velocity Profile  
and Fluid Shield

PIV Instantaneous Velocity Vectors

Phased Array Acoustic Source Distributions

# N+2 GE IVP—Empirical Tools

## djet Predictions (June 2011)

- Simple code based on approximating multi-stream jet by equivalent shear layers
- Developed for conventional velocity profiles—applied to IVP.
- Assumed convergent nozzles—did not account for separation noise!

# N+2 GE IVP—RANS-based Tools

Fluent/JeNo\* (June 2011)

Turbulent Kinetic Energy

GE RANS CFD

NASA PIV

Causes for mismatch:

- JeNo calibrated for cold jet only
- Significant TKE near nozzle

# N+2 GE IVP—LES

GE-Global (Sept 2011)

---

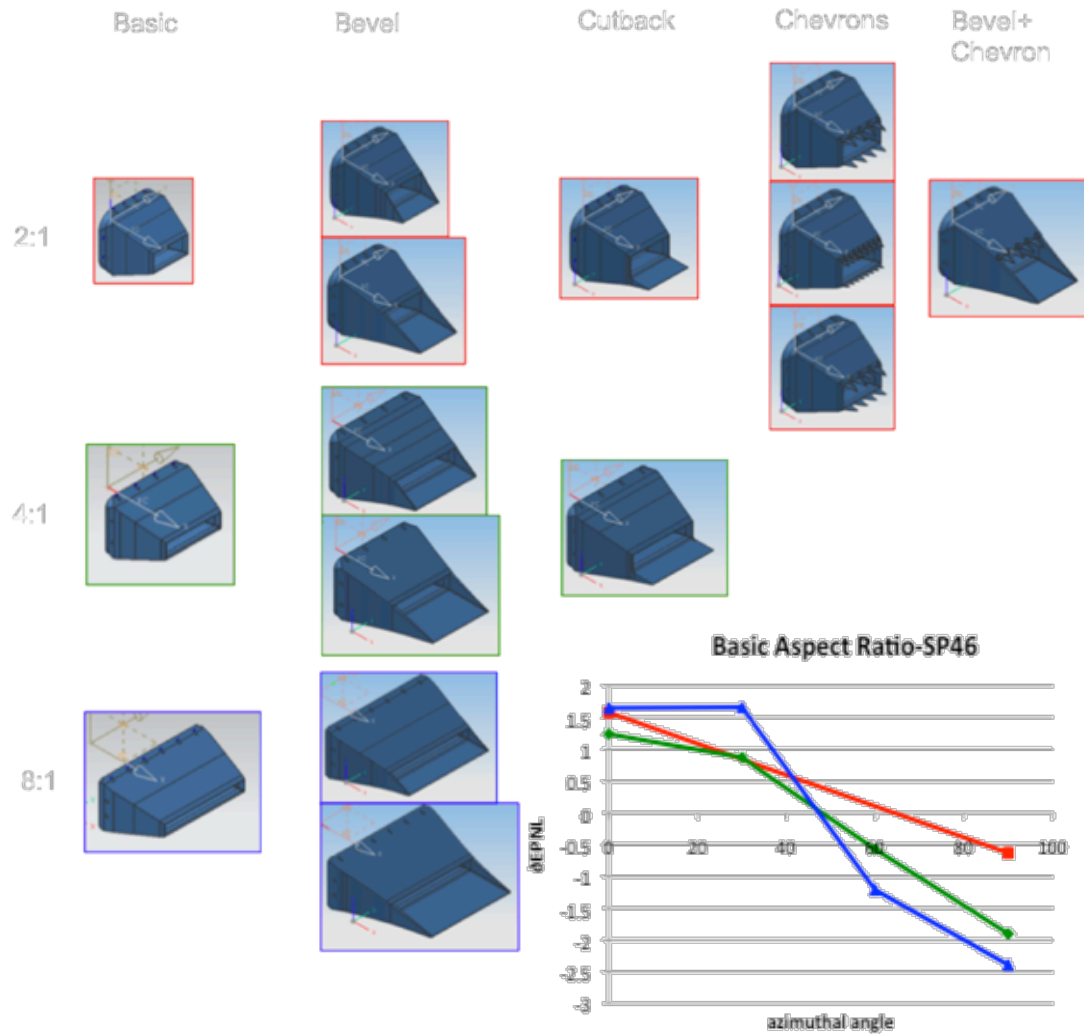

In process—GE has not delivered yet

# High Aspect Ratio Nozzle—Experiments

## Extensible Rectangular Nozzle (ERN11) (Feb 2011)

# High Aspect Ratio Nozzle—Experiments

## Extensible Rectangular Nozzle (ERN) 2<sup>nd</sup> gen

- Take existing 2:1 and 8:1 nozzles...

- Create new concepts based on ERN11 findings

# High Aspect Ratio Nozzles—Empirical Modeling

## Aspect Ratio-Bevel Length Model (April 2011)

- An empirical model was constructed for the spectral directivity of the ERN11 data relative to an axisymmetric nozzle.
- Coefficients for Aspect Ratio and Bevel Length as a function of frequency and spherical directivity.
- Shown: Fitted coefficients for two frequencies, one observer location versus data.

# High Aspect Ratio Nozzles—RANS-based Tools

## Elliptic Approximate Green Function (2011)

- Conformal mapping of Elliptic mean plume profiles to create Green's functions for propagation of sound through high-aspect-ratio plumes.
- Use in existing Acoustic Analogy jet noise codes.

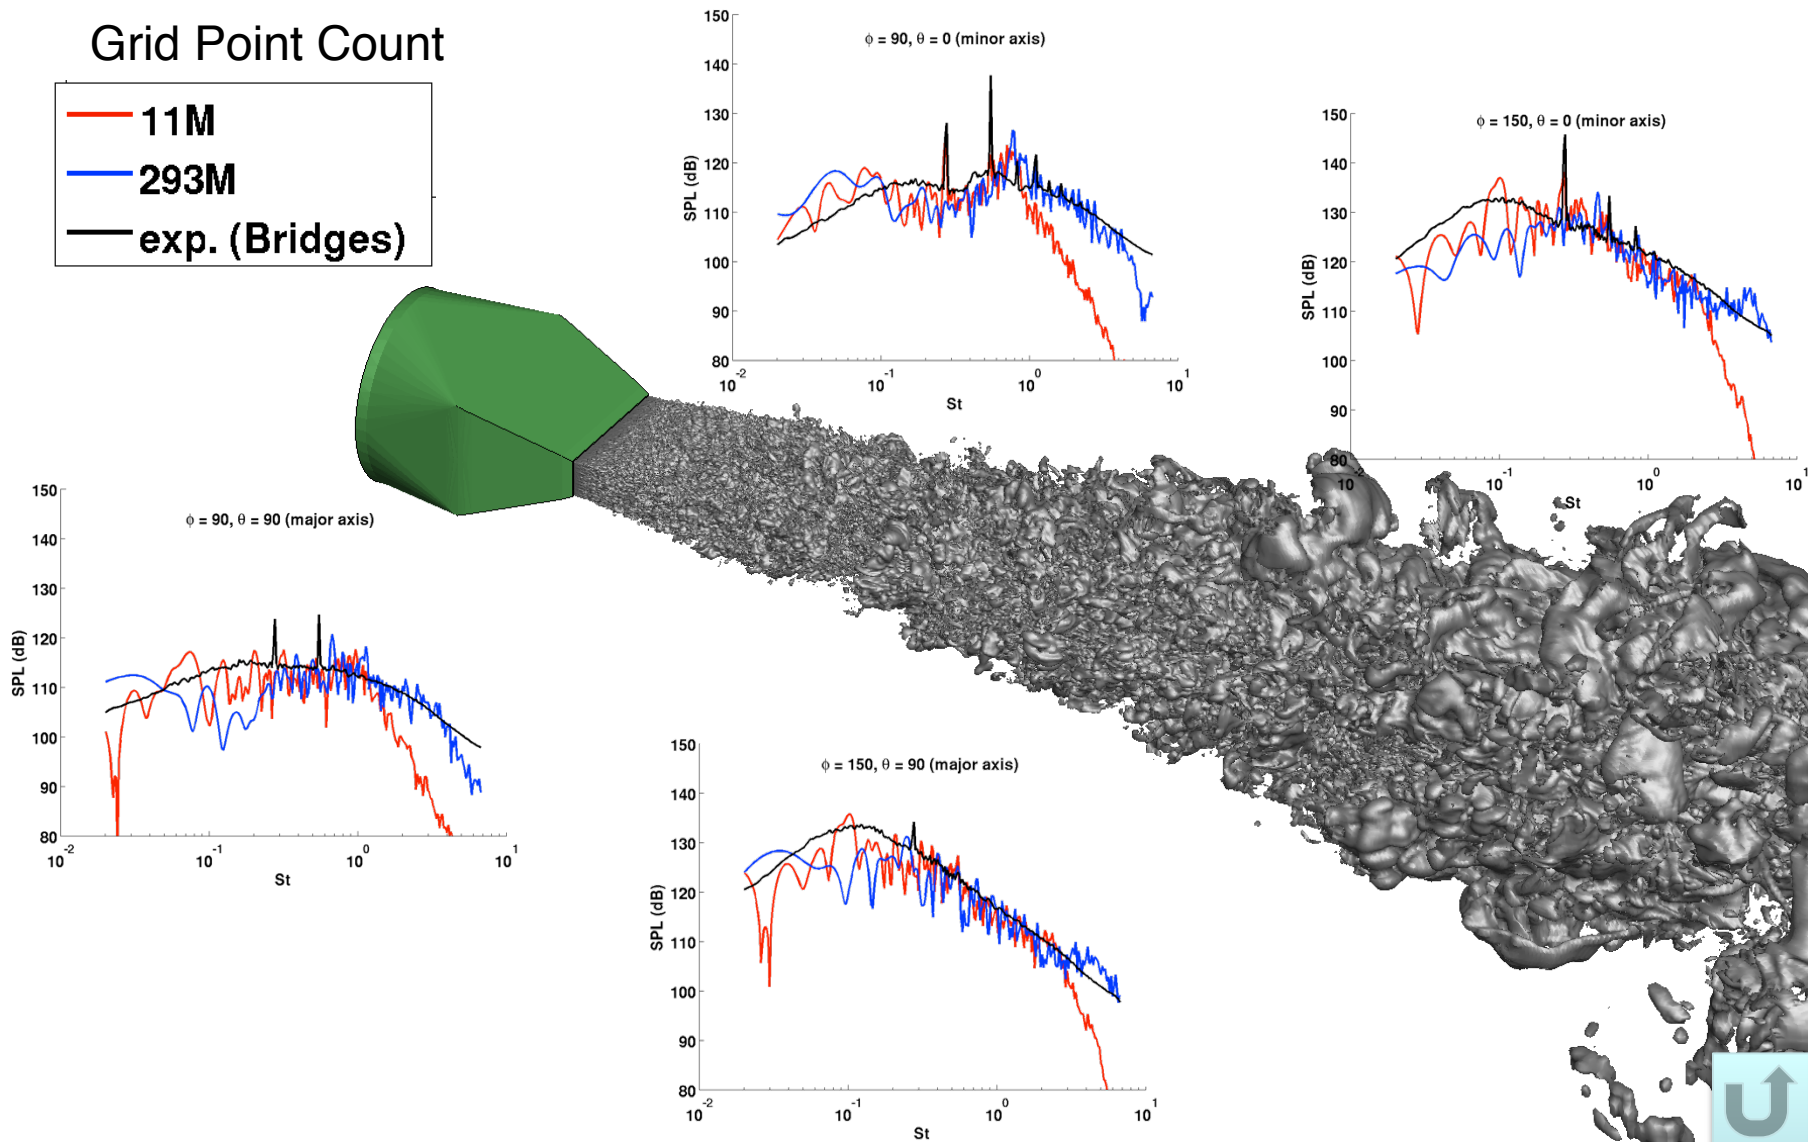

# High Aspect Ratio Nozzles—Large Eddy Simulations

## Stanford NRA/CharLES

Grid Point Count

# Multiple Jet Effects—Experiments

## Twn10 and Twn12 Tests (May 2010)

- TWN10 using axisymmetric nozzles, diameter  $D$ , varying center-to-center spacings  $s$  over the range  $2 < s/D < 5$ .
- Mapped out spherical directivity for range of flows with and without forward flight.

- Next test is Twn12 using rectangular nozzles from the ERN11 test (Spring 2012).
- Aspect ratios 2:1 and 8:1 with varying bevel length will be tested.
- PIV will also be acquired during Twn12 for both twin round, single rectangular, and twin rectangular configurations.

# Multiple Jet Effects—Empirical Tools

Twin Jet ANOPP module (Coming 2012)

- Expect to use data from Twn10 and Twn12 tests to produce an empirical dataset for spectral directivity differences from single jet
- Parametrically vary jet spacing.

# Multiple Jet Effects—RANS-based Tools

## Approximate Green's Function for Twin Jet (Dec 2011)

- Conformal mapping of TwinJet mean plume profiles to create Green's functions for propagation of sound through twin plumes.
- Use in existing Acoustic Analogy jet noise codes.

$$W(z) = u(y_2, y_3) + iv(y_2, y_3) = \ln(z^2 - C^2)$$

$z = y_2 + iy_3$ ,  $C$  is a real constant

- Maps region  $-\infty < u < \infty$ ,  $-\pi < v < 3\pi$  to Cassinian ovals (constant  $u$ ) in  $y_2, y_3$ .
- Approximate mean velocity and temperature contours.

# Mixer-Ejector — Experiments

## N+2 RRLW Mixer-Ejector Test (April 2011)

# Mixer-Ejector—Experiments

## Parametric Mixer-Ejector Test (Summer 2013)

- Objective: Design a series of Mixer-Ejector nozzles to provide parametric acoustic performance data for empirical and RANS-based prediction codes.
- Base parametric designs on (1) RTM performance code predictions, (2) RANS-based CFD with existing empirical acoustic predictions.
- Currently envisioning axisymmetric designs, possibly with enhanced mixer. Parametrically vary mixer/ejector area ratio, ejector length, primary flow and flight speed.
- Schedule:
  - Flow lines in Q2-Q3/FY12
  - Model mechanical design in Q4/FY12
  - Model fab in Q1-Q2/FY13 with test Q4/FY13

# Mixer-Ejector—Empirical Tool

---

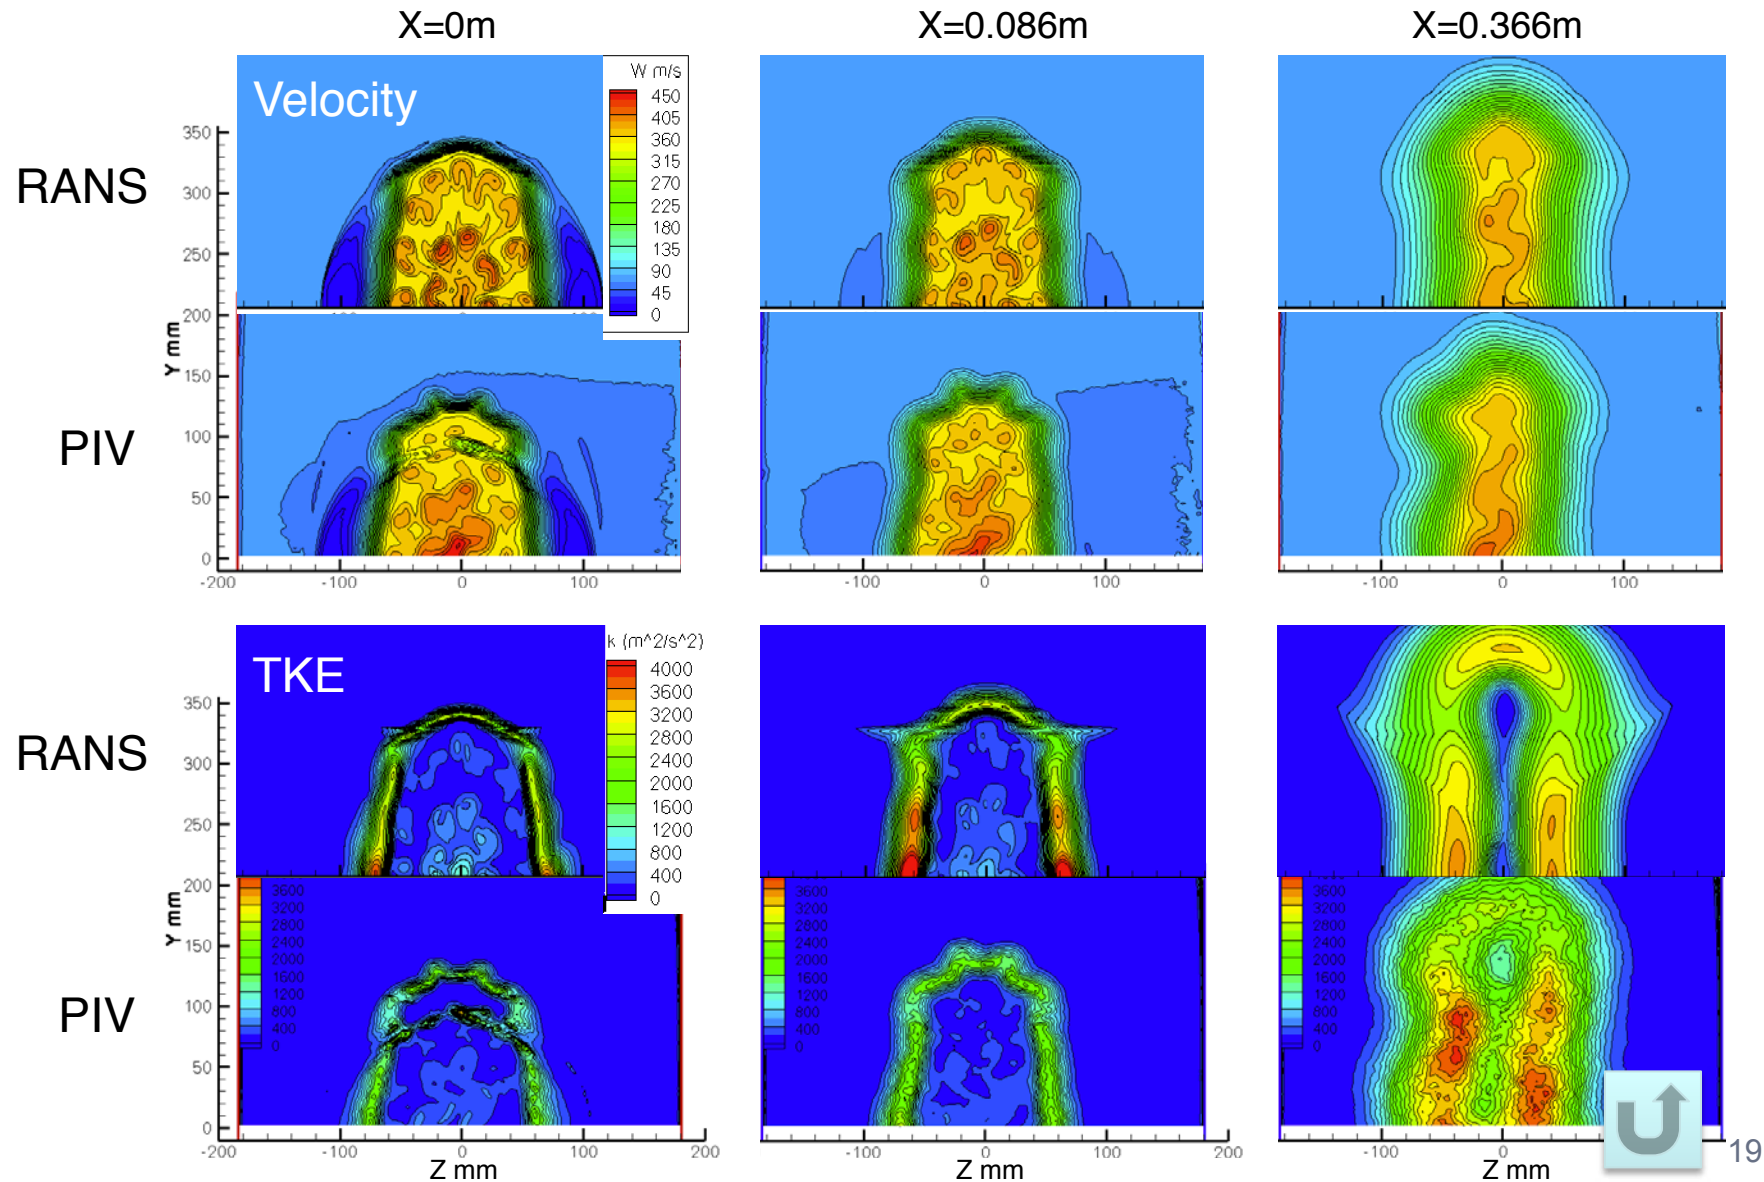

- To be based on Parametric Mixer-Ejector testing and RTM Mixer-Ejector performance codes

# Mixer-Ejector—RANS-based Tools

## HVC10 Mixer-Ejector—NASA-Generated RANS solution

# Plasma Actuator for Jet Control—Experiments

PAJE11 (March 2011)

- Linear scale-up of 1"Ø C-D nozzle experiment at OSU.
- 48 Plasma Arc Actuators on 6.5"Ø,  $M_0=1.3$  nozzle mounted on NASA GRC's High Flow Jet Exit Rig.
- Used new OSU-designed electronics.
- Measured near-field instability wave and far-field acoustic response to input excitation.
- Found minimal effect.

# Plasma Actuator for Jet Control—Experiments

PAJE12 (Fall 2011)

- Will reproduce OSU result exactly
- Scale up incrementally
  - Use existing ARN1 (1"Ø), ARN2 (2"Ø), and ARN3 (3"Ø) nozzles
- OSU design and fab ceramic collars + electrodes
- OSU modify/fix plasma actuator electronics
- Test in November/December on NASA GRC's Small Hot Jet Acoustic Rig.

Original ARN2

Modified ARN2

With ceramic extension

# Plasma Actuator for Jet Control—LES

- LES solution coupled with Adjoint-based optimizer to minimize sound pressure using body forces at nozzle exit.
- UIUC/Bodony & Freund

## **Fundamental Aeronautics Program/Supersonics Project Airport Noise Tech Challenge Status—Fall 2011**

---

- Synopsis: An overview of the Airport Noise Technical Challenge area research is presented, first in milestones and second by task. A 'home page' containing the matrix of Concepts and Tools is used as a launching ground for pages that give brief status of each task in the Technical Challenge area. Tasks cover the low noise nozzle concepts of Offset Stream, Inverted Velocity Profile, High Aspect-Ratio, Multiple Jets, Mixer-Ejector, and Plasma Actuators. Tools being deployed to develop and document these Concepts are Experiments, Empirical codes, Reynolds-Averaged Navier-Stokes-based codes, and Large Eddy Simulations.
